

# Shadowing and radiative corrections at low $x$ and $Q^2$

Antje Bruell  
Hall C summer workshop, August 2008

# Motivation

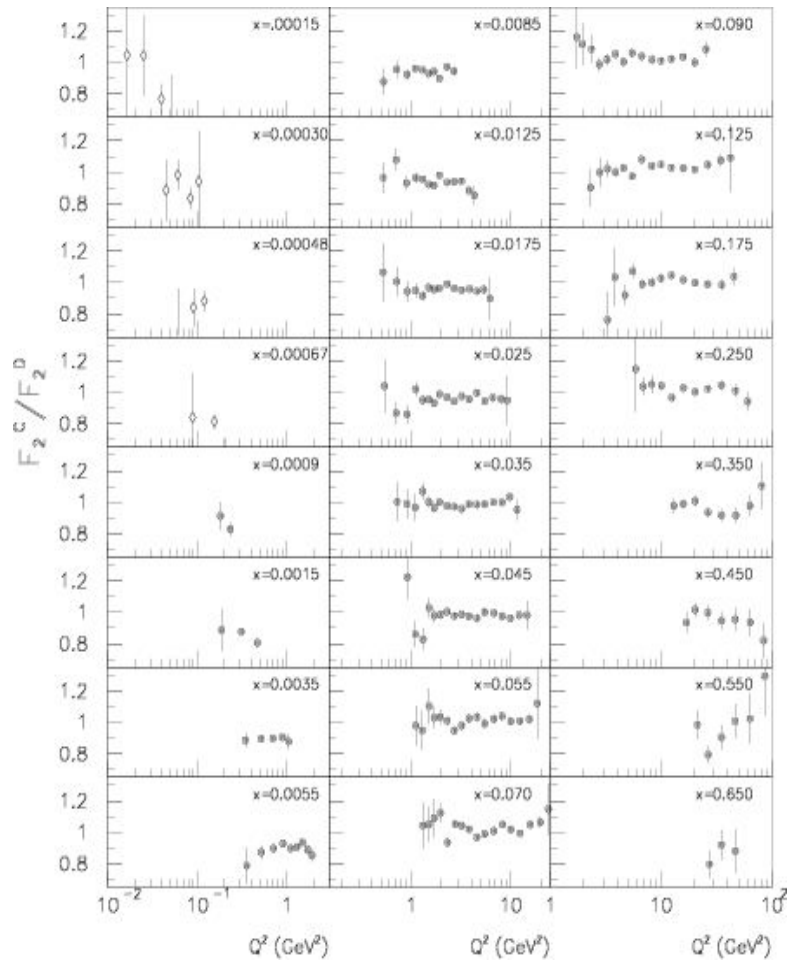

- **x- and A-dependence of the EMC effect**

# Motivation

- $Q^2$ -dependence of the EMC effect**

# Motivation

- $Q^2$ -dependence of the EMC effect

# EKS98

⇒ Parametrize  $R_{F_2}^A(x)$  at  $Q_0^2 = 2.25 \text{ GeV}^2$

⇒ Valence quarks  $R_{u_V}^A = R_{d_V}^A = R_V^A(x)$

↘ Large-x fixed to  $R_V^A \simeq R_{F_2}^A$

↘ Intermediate-x by DY

↘ Rest: Baryon number sum rule

⇒ Sea quarks  $R_{\bar{u}}^A = R_{\bar{d}}^A = R_{\bar{s}}^A = R_S^A(x)$

↘ Small-x fixed to  $R_S^A \simeq R_{F_2}^A$

↘ Intermediate-x by DY

↘ Large-x: assumption

⇒ Gluons

↘ Large/small-x fixed to  $R_g^A \simeq R_{F_2}^A$

↘ Intermediate-x: DGLAP

# Approximate ranges and constraints in EKS98

## Valence

## Sea quarks

## Gluons

- Constrained by DIS
- Constrained by DY
- Constrained by Sum rules

# Comparison of different parametrisations

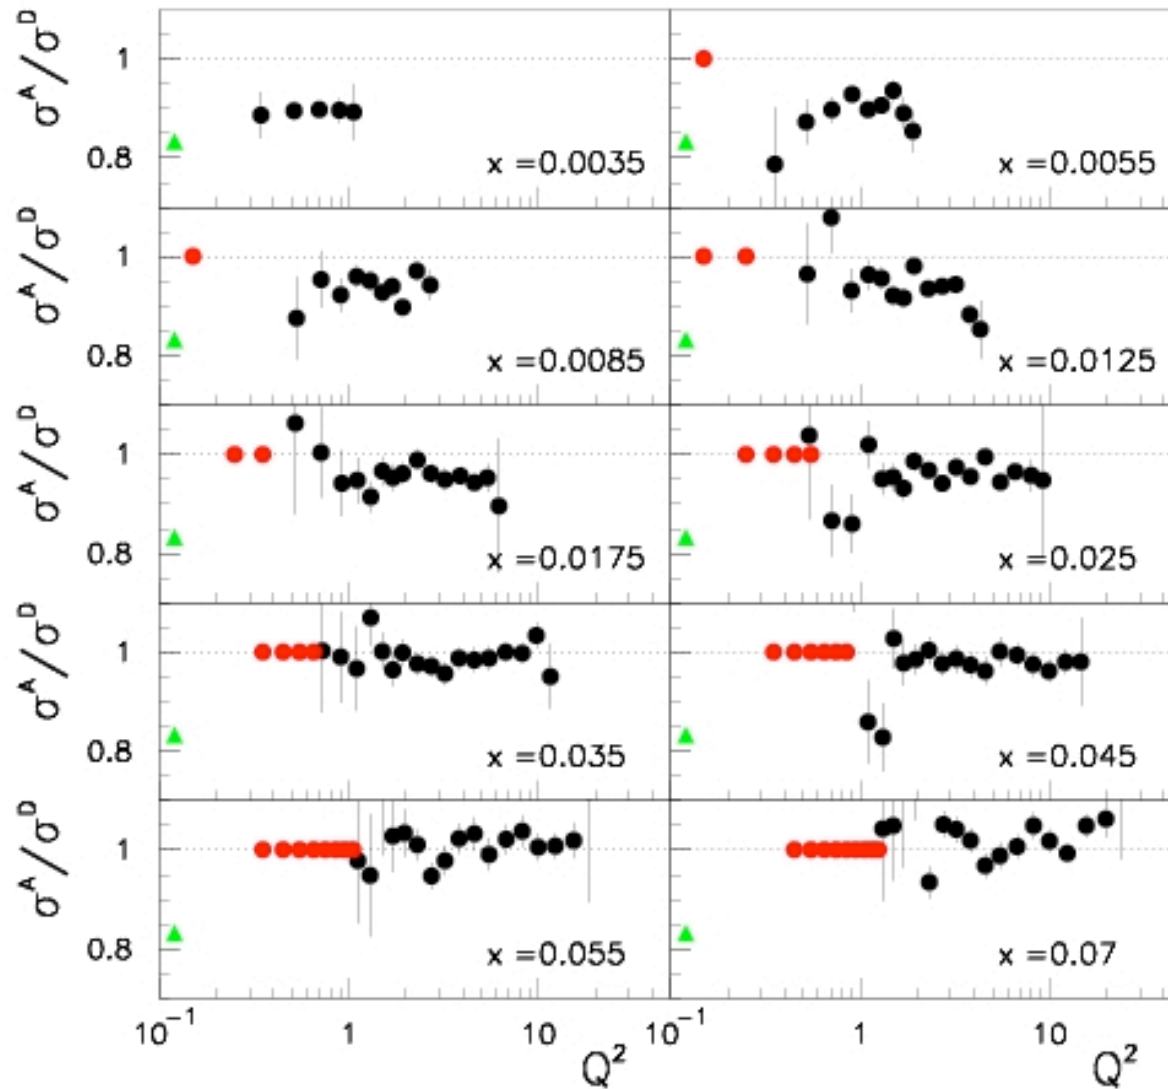

# $Q^2$ evolution of $R_G^A$

DGLAP evolution removes the nuclear effects very efficiently

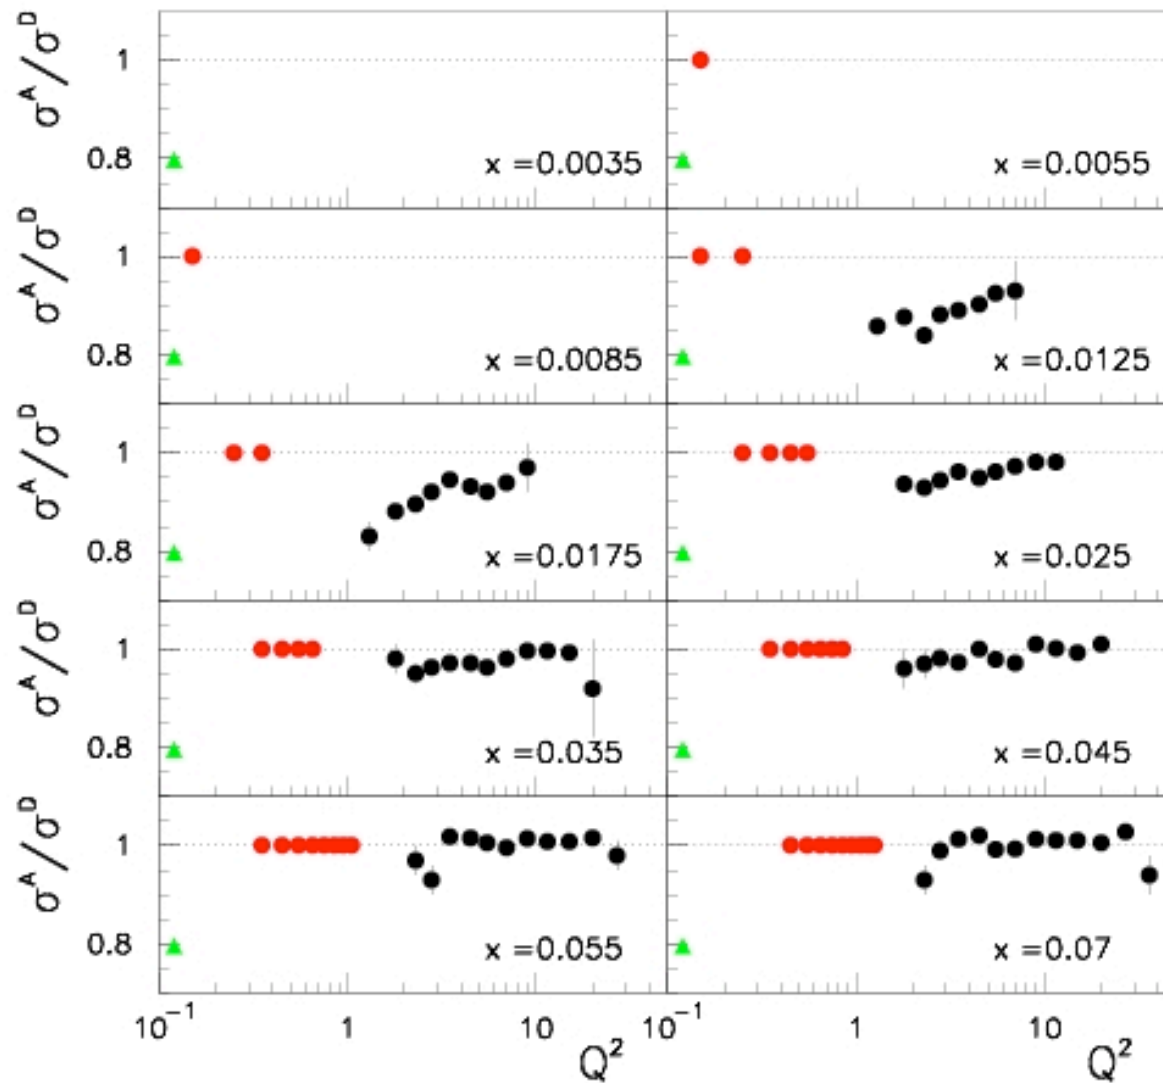

# Possible Measurements @ 12 GeV

C/D

# Possible Measurements @ 12 GeV

Sn/C

# What's the problem ?

- huge radiative effects at extreme kinematics
- radiation from elastic and quasielastic scattering dominant at low  $E'$
- both external and internal effects important
- higher order effects important
- additional complications for heavy nuclei

➤ dedicated measurement of radiative effects

# Measurement of radiative effects

- select kinematics with large radiative effects
- Measure the spectrum of emitted photons up to angles of  $\sim 2^\circ$
- Calorimeters around beam and scattered electron directions
- beam currents of  $\sim 10$  nA to avoid radiation damage

# Measurement of radiative effects

# Measurement of radiative effects

**beam electron**  
**22x22 crystals (2x2x18cm<sup>3</sup>)**

**scattered electron**  
**7x7 crystals**

# Measurement of radiative effects

---

**beam electron: reconfiguration of HYCAL**

# Measurement of radiative effects

# Summary

---

- $Q^2$  dependence of shadowing not understood
- important for determination of gluon distribution in nuclei
- previous measurements with electron beams limited by systematic uncertainties in radiative corrections
- 11 GeV beam allows measurements connecting to previous NMC experiments at low  $x$
- Control of systematics requires to measure the spectrum of emitted photons
- Calorimeters around beam and scattered electron directions for dedicated measurements at low currents
- possibility to measure  $F_L$  and its truncated moment presently under study
- parallel measurements of  $R_H$  and  $R_D$  at low  $x$  and  $Q^2$
